

## Parking Lot Management

“With my membership ID, I can easily access the parking lot.”

### Security:

- Protection against unauthorised access to the secured property
- Logging of all entrances and exits
- Individual and time-related control of credentials

### Efficiency:

- Fast, easy operation
- Short waiting times at barriers and gates
- Attribution of parking areas
- Logging of usage payments

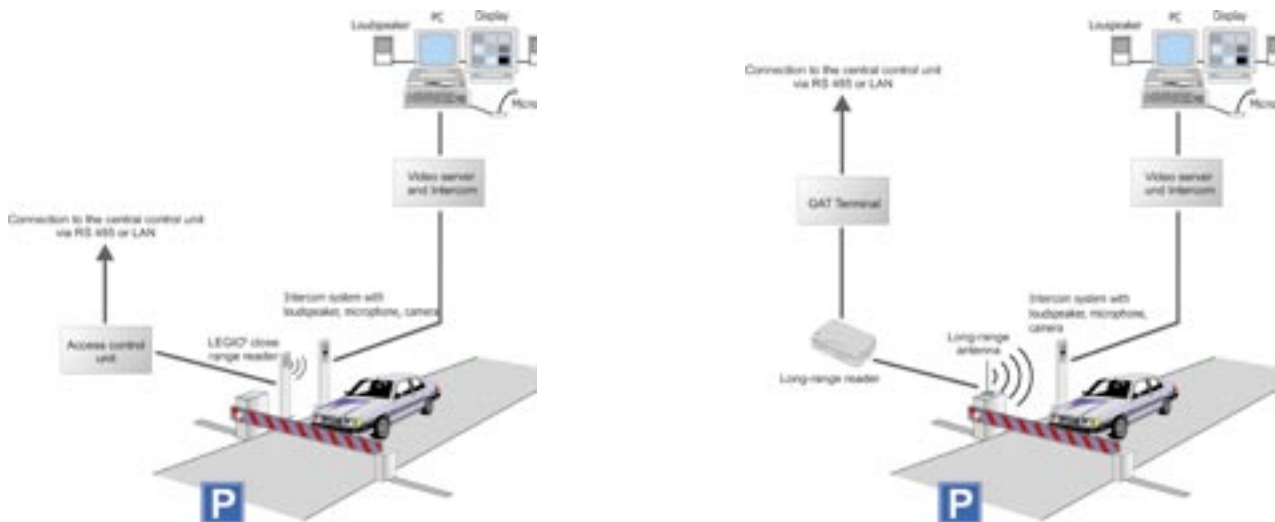

### Convenience:

- Easy identification
- Linkage between video pictures and access control
- Remote controlled opening of the barrier by the gatekeeper

# The GANTNER solution in detail

An access control reader is mounted at the parking entrance. The reader is either integrated into an access control or club management system or functions as a standalone (offline). The reader carries out the identification via the membership card serving as contactless data carrier.

The contactless membership card is held in front of the reader (reading range of cards approx. 8-10cm, irrespective of the position, dirt and water resistant); it captures the information stored on the chip and forwards it to the terminal. After the positive verification of the credentials profile, the terminal sends a signal to open the barrier, the gate etc. All authorised accesses as well as the unauthorised access attempts are recorded and can be analysed by the access control software.
